

Bermer Platform: Customizable Tabs Overview

Bermer is a unified AI assistant platform that supports customizable, installable apps and flexible navigation through a browser-like interface.

This overview describes a multi-role experience where different user groups—restaurants, store owners, and riders—can customize their workflow within a single application.

Customizable Tabs: Users can add tabs for their workflows, remove tabs they no longer need, and pin important ones for quick access.

Restaurants: Restaurant staff can add their operational tabs, such as orders, menus, and management views, within the unified app.

Store Owners: Existing store and owner apps can appear as tabs, bringing management tools into one interface.

Riders: Delivery riders can use dedicated tabs to manage assignments and deliveries, also within the unified app.

Unified Experience: All roles access a single application with consistent navigation, while each user configures their own workflow.

Benefits: A browser-like, advanced interface that reduces context switching, improves discoverability, and keeps users within the app.
